

Zomato Dataset Analysis

Alfido Tech – Data Science Internship | Tools: Python, Pandas, Matplotlib, Google Colab

Objective

The objective of this project is to perform Exploratory Data Analysis (EDA) on a Zomato restaurant dataset and identify patterns related to cuisines, cities, restaurant ratings, and prices.

Dataset Overview

- 123,657 records
- 26 columns
- No missing values
- Dataset sourced from Kaggle

Analysis Performed

- Inspected dataset structure and data types
- Checked for missing values
- Generated summary statistics
- Analyzed the most common cuisines
- Analyzed cities with the highest number of records
- Studied restaurant rating distribution
- Examined price versus average rating

Key Findings

- Beverages was the most represented category with **39,441 records**.
- Hyderabad had the highest number of records with **15,613**.
- Restaurant ratings ranged from **3.0 to 4.65**, with an average of approximately **3.89**.
- The average listed price was approximately **₹241.38**.
- Listed prices ranged from approximately **₹0.95 to ₹12,024**.

Conclusion

The analysis provides useful insights into restaurant categories, geographical distribution, ratings, and pricing. The visualizations make the patterns in the dataset easier to understand and provide a foundation for further restaurant and customer analysis.
